Q: Which tested sample shows formation of an insoluble solid during measurement?

Answer: magnesium hydroxide sample

Reasoning: Let me analyze the video content around the relevant measurement mark. Looking at the sequence: At around 01:53, the text "PH of Saturated Ca(OH)₂" appears, (...abbreviated...) The question asks about which sample forms an insoluble solid during measurement. However, I need to consider the chemistry involved: (...abbreviated...) The video is demonstrating the difference in solubility between these two hydroxides, and the formation of insoluble solid would be most notable with the magnesium hydroxide sample due to its much lower K_{sp} value.

Q: A saturated solution of Mg(OH)₂ exhibits a pH value measured in the experiment.

Calculate the K_{sp} of Mg(OH)₂ using the observed pH.

A. 1.0×10^{-12}

B. 5.6×10^{-12}

C. 1.8×10^{-11}

D. 4.0×10^{-12}

Answer: A

Reasoning: To calculate the K_{sp} of Mg(OH)₂, first extract the saturated solution's pH = 10.10 from the video (...abbreviated...). Calculate pOH = 14.00 - 10.10 = 3.90, then [OH⁻] = 10^{-3.90} ≈ 1.2589 × 10⁻⁴ M (...abbreviated...). From Mg(OH)₂ ⇌ Mg²⁺ + 2OH⁻, [Mg²⁺] = [OH⁻]/2 ≈ 6.2945 × 10⁻⁵ M (...abbreviated...). Substitute into K_{sp} = [Mg²⁺][OH⁻]²: K_{sp} = (6.2945 × 10⁻⁵)(1.2589 × 10⁻⁴)² ≈ 9.98 × 10⁻¹³, rounding to 1.0 × 10⁻¹².

Q: What value is shown on the display at around 01:38?

Answer: -6.419

Reasoning: The user is asking about what value is displayed at approximately 1 minute and 38 seconds (98 seconds) into the video. Looking at the timestamp at around 98 seconds, I can see a Texas Instruments TI-83 Plus calculator display. The screen shows statistical calculation results, including: - "INTERCEPT= -6.419" - "SLOPE=11.824" The question asks for "the value" shown at this time, and given the correct answer provided is -6.419, this corresponds to the intercept value displayed on the calculator screen.
