Q: What is the overall trend in thermometer reading?

Answer: Rising **Reasoning:** (...abbreviated...) The liquid column between 1:06 – 1:12 is rising (...abbreviated...)

Q: What is the role of the black solid?

A. Homogeneous catalyst B. Oxidant C. Heterogeneous catalyst D. Dehydrating agent

Answer: C **Reasoning:** (...abbreviated...) MnO_2 (solid) catalyzes H_2O_2 (liquid), therefore it is a heterogeneous catalysis.

Q: Using the same solution as in the video (35.0mL, 18.0%(w/w), density 1.08g · mL⁻¹) and excess black powder, determine the volume of dry gas produced at STP.

Answer: 2.24L **Reasoning:** From 00:30 to 00:52 in the video, we (...abbreviated...), therefore, we identify the demo as the decomposition of hydrogen peroxide to water and oxygen ($2H_2O_2 \rightarrow 2H_2O + O_2$). (...abbreviated...) For 35.0mL of an 18.0%(w/w) solution ($\rho = 1.08g/mL$), the solution mass is $35.0 \times 1.08 = 37.80g$; therefore, $m(H_2O_2) = (...abbreviated...)$ the dry oxygen volume is $0.1 \times 22.414 \approx 2.24L$.
