What are the **Gene Ontology terms (biological process)** for this protein?
 <protein>MKRAV...RKLLD</protein> <protein_structure>D F W K F ... G D D D D
 <protein_structure> Only the biological process (BP) aspect.

First, I examine the **overall structural architecture** encoded in the 3Di string ...

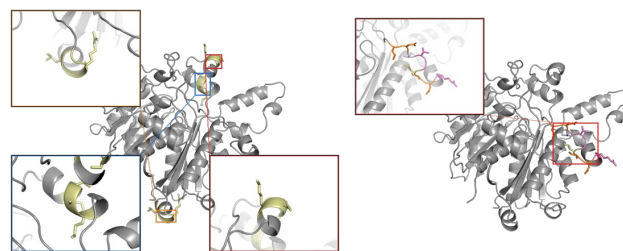

There are significant runs of residues encoding **alpha-helical conformations**, such as the segment <protein_structure>**VVVV**</protein_structure>, which appears **multiple times**. According to the 3Di rules, **runs of V and L correspond to alpha-helices** ...

Conversely, I see segments like <protein_structure>**DDLPPVDDP**</protein_structure>, which suggest **beta-strand or turn-rich regions**. The alternation between these helical (V/L) and strand/loop (D/P/A) elements indicates an **alpha/beta protein fold**, which is characteristic of **enzymatic domains, particularly those involved in metabolism** ...

The presence of **glycine-rich regions** is often associated with **nucleotide or acyl-CoA binding**, which is common in biosynthetic pathways ...

Therefore, the biological processes should reflect **lipid metabolism, specifically the biosynthesis and modification of fatty acids** and their derivatives ...
