

Q: Generate an instance segmentation visualization of this image. Each `<p>car</p>` is colored differently. First, enumerate each visible `<p>car</p>` instance mentioned in the request and assign each `<p>car</p>` a different solid color. Reformat them in the EXACT format: `<p>car-no<color>(R,G,B)</color></p>`. Then respond with interleaved instance segmentation masks using those instance labels and colors.

Caption output: `<p>car-0<color>(255, 255, 255)</color></p>`, `<p>car-1<color>(255, 13, 156)</color></p>`, `<p>car-2<color>(254, 255, 111)</color></p>`, `<p>car-3<color>(254, 91, 109)</color></p>`,...

Original
(46 instances annotated)

X-SAM
(33 instances segmented)

SenseNova-Vision
(65 instances segmented)
