

Part 1: Foresight in OPD - Early Determination of Module-Allocation and Update-Directions

(a) Illustration: Foresight = Early Prediction of "Which Mountain" and "Which Direction"

**RL (No foresight)**

Wastes many steps exploring wrong mountains and directions

**OPD (Has foresight)**

Focuses on the right mountain and takes the right path directly

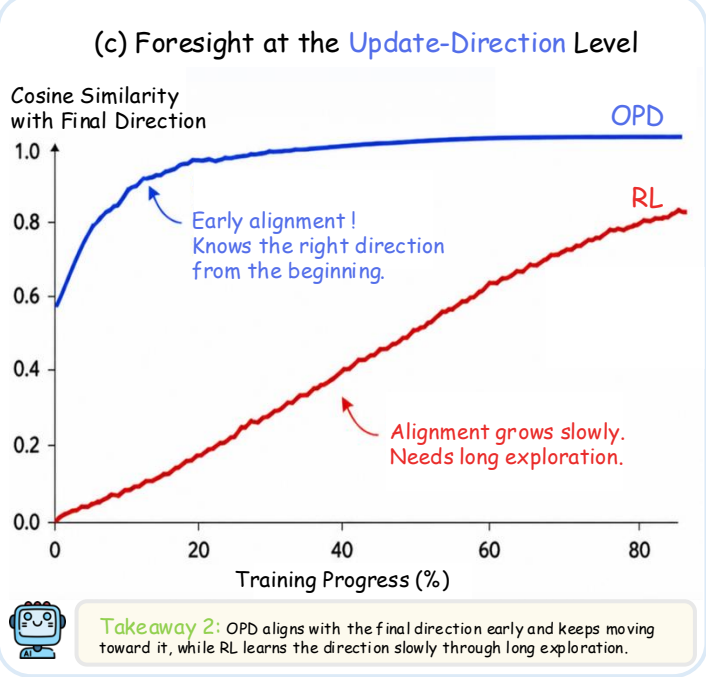

Why does OPD have foresight?

(b) Foresight at the Module-Allocation Level

| Base      | RL        | OPD       |
|-----------|-----------|-----------|
| LM_head   | LM_head   | LM_head   |
| layer9    | layer9    | layer9    |
| layer8    | layer8    | layer8    |
| layer7    | layer7    | layer7    |
| layer6    | layer6    | layer6    |
| layer5    | layer5    | layer5    |
| layer4    | layer4    | layer4    |
| layer3    | layer3    | layer3    |
| layer2    | layer2    | layer2    |
| layer1    | layer1    | layer1    |
| Embedding | Embedding | Embedding |

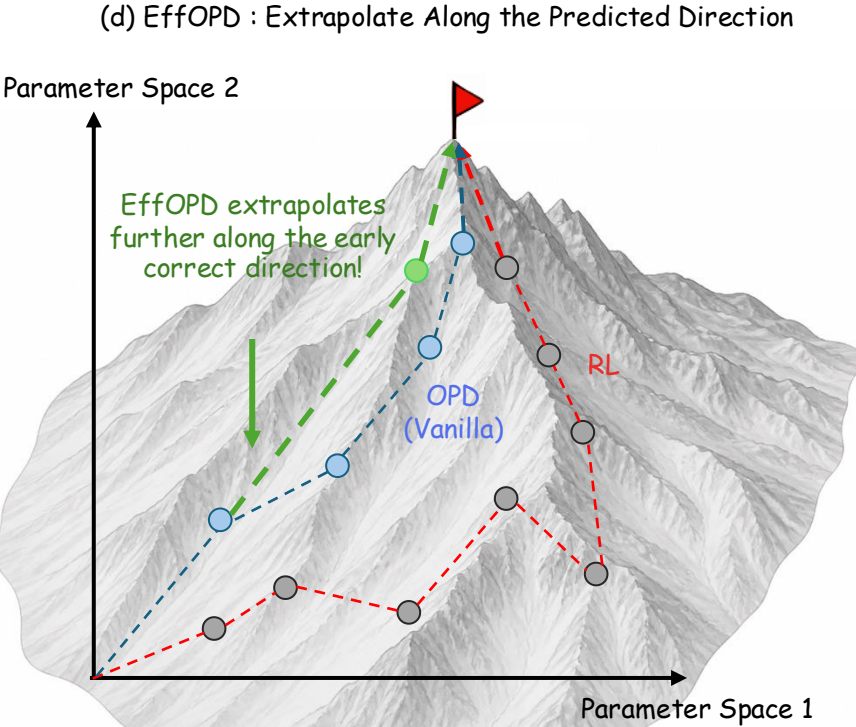

*Critical Module* (layers 4-6)

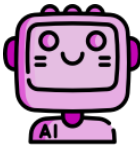

**Takeaway 1:** OPD performs efficient, small-magnitude updates on key modules, while RL produces larger updates and accumulates redundancy in non-critical regions.

Part 2: Leveraging Foresight for Acceleration

**Motivation.** Since OPD already identifies the correct mountain and direction early, we can extrapolate further along this trajectory to reach the summit with far fewer steps.

**Advantages:**

- 1. Plug-and-play, No Extra modules
- 2. Orthogonally compatible with other methods
- 3. Comparable final performance

**RL:** Reinforcement Learning      **OPD:** On-Policy Distillation
