

# Case 2: Terminal File Organization and Compression

Two different OS terminal skills are consulted; the branch gates off images and returns command-level guidance.

Task "Compress files older than 30 days into old\_files, and move all other files into new\_files."

score 1.0 | 8 actions | 2 skills

|         |                                                                                                                              |
|---------|------------------------------------------------------------------------------------------------------------------------------|
| Turn 0  | Action                                                                                                                       |
| Input   | Terminal is active. The task requires separating files by modification time into old_files and new_files.                    |
| Output  | mkdir -p /tmp/test_files/old_files /tmp/test_files/new_files                                                                 |
| Effect  | Both destination directories are created.                                                                                    |
| Turn 1  | Action                                                                                                                       |
| Input   | Destination directories exist. The agent starts moving files older than 30 days.                                             |
| Output  | find ... -mtime +30 -exec mv {} old_files/ \;                                                                                |
| Effect  | The shell command needs correction because the exec terminator is fragile in typed terminal input.                           |
| Turn 2  | LOAD                                                                                                                         |
| Input   | Recent command did not make reliable progress. The issue is file movement in a terminal.                                     |
| Output  | LOAD_SKILL("Modify Files and Folders in Terminal")                                                                           |
| Effect  | A first temporary branch is opened for command-repair guidance.                                                              |
| Turn 2B | Branch                                                                                                                       |
| Input   | Skill package + live terminal screenshot. Stage 1 gates off reference images because textual terminal context is sufficient. |
| Output  | structured guidance: correct the failed find command; avoid repeating the unescaped semicolon path.                          |
| Effect  | Guidance returns to the main agent before the next typed command.                                                            |
| Turn 3  | Action                                                                                                                       |
| Input   | The branch identifies the current failure mode: fragile find -exec syntax.                                                   |
| Output  | retry find with a quoted semicolon terminator                                                                                |
| Effect  | The agent attempts a repaired command path.                                                                                  |
| Turn 4  | Action                                                                                                                       |
| Input   | The semicolon form remains brittle in the terminal interaction.                                                              |
| Output  | find ... -mtime +30 -exec mv -t old_files/ {} +                                                                              |
| Effect  | A robust find command moves old files into old_files.                                                                        |
| Turn 5  | LOAD                                                                                                                         |
| Input   | Old files have been moved. The remaining subgoal is archive creation and final verification.                                 |
| Output  | LOAD_SKILL("Archive, Extract, and Convert Files in Terminal")                                                                |
| Effect  | A second, different skill branch is opened.                                                                                  |
| Turn 5B | Branch                                                                                                                       |
| Input   | Skill package + live terminal screenshot. Stage 1 again gates off reference images for a text-only shell workflow.           |
| Output  | structured guidance: run ls -R, compress old_files, then verify the directory tree.                                          |
| Effect  | The main agent receives archive-and-verification guidance.                                                                   |
| Turn 6  | Action                                                                                                                       |
| Input   | The next checkpoint is to inspect which files are in each directory.                                                         |
| Output  | ls -R /tmp/test_files                                                                                                        |
| Effect  | The terminal prints the current file distribution.                                                                           |
| Turn 7  | Action                                                                                                                       |
| Input   | old_files contains the target old files and is ready to be archived.                                                         |
| Output  | tar -czf old_files.tar.gz -C old_files . --remove-files; ls -R                                                               |
| Effect  | The old-file archive is created and the final directory tree is verified.                                                    |
| Turn 8  | Done                                                                                                                         |
| Input   | The terminal output shows the archive and the expected file organization.                                                    |
| Output  | DONE                                                                                                                         |
| Effect  | The task is marked complete with score 1.0.                                                                                  |
