

Scaling of Collective Remembering Metrics with Agent Count

Data Points: N=3, 5, 7

Power-Law Fit: $y = a * N^b$

Note: Only 3 data points available.

Power-law fitting with N=3 limits statistical reliability.

Exponents should be interpreted as preliminary estimates.

Specialization Index: $a=0.85$, $b=-0.12$

Retrieval Efficiency: $a=0.92$, $b=0.05$
