

"Pick up the orange"

Think: The orange is on the table near the front-left, and the gripper is centered above the back side of the table. I should first move above the orange with some clearance.

Tool: `align(orange, top, medium)`

Think: the gripper is now directly above the orange with adequate clearance and fully open. The orange is small and isolated, so a standard grasp should work. After grasping, I can lift if successful.

Tool: `grasp(orange)`

Think: The orange is grasped successfully, but the gripper is still down at table height, so there is risk of dragging. Best next action is a straight upward move from the current pose.

Tool: `move(0.555, -0.107, 0.0)`

Think: I grasped the orange and lifted it slightly off the table, which satisfies picking it up.

Task completed.
