

Trajectory in offline task

- 1 Use apache to setup a webserver
- 2 Edit port, sites in persistent configs
- 3 Install apache2 as service
- 4 Do runtime validation with `curl`

Attribution & Evolve

1. Use apache for stable server
2. Use system service
3. Persist configuration
4. End to end validation

ubuntu-apache-vhost/SKILL.md

- 1 Set global listener in ports.conf
- 2 Setup site with `a2ensite`
- 3 Check with `apache2ctl -S` when edit
- 4 Set apache as system service
- 5 Rules: Always do end to end validation

Online Task

Configure a git server so that I can clone, commit, and push a file to webserver as hello.html

Trajectory w/ evolution

- 1 Read `ubuntu-apache-vhost/SKILL.md`
- 2 Setup apache-server on 8080
- 3 Bind git post-receive hook to website
- 4 `curl -sS `http://server:8080/hello.html``

Difference

Apache server ↔ Small server
System Service ↔ One-time Script
Full Validation ↔ No Validation

Trajectory w/o evolution

- 1 Create bare repo and post-receive hook
- 2 Create a small node server on 8080
- 3 Add a `run-webserver.sh` and `setup.sh`
- 4 Without runtime validation
