

	Submit	Evidence	Attribution	Policy revision	Outcome
GPT-5.5	s001 16 ep	Early instability; reward drops indicate loss of early-bend progress.	→ Weak late-bend recognition; minor mask gaps.	→ Increase lookahead, merge mask gaps, reduce speed on sharp turns.	→ new best
	Codex s013 115 ep	Removing nudge helps one case but hurts broader performance.	→ Weak nudge is broadly useful despite local failure.	→ Restore nudge; increase exploration on fresh cases.	→ rollback
Claude Opus 4.7	s001 10 ep	Agent gets stuck on grass; no throttle, braking dominates movement.	→ Braking is overly conservative, preventing escape from off-road states.	→ Switch to continuous forward motion policy with smoother steering during recovery phases.	→ new best
	Claude Code s014 124 ep	Average return decreases; previously solved recovery cases fail again.	→ Removing active braking harms difficult recovery situations that still require deceleration control.	→ Restore earlier brake-based recovery strategy.	→ No improvement
Minimax-M3	s001 24 ep	Most frames contain only grass with no reliable road signal.	→ Lack of robust off-road recovery beyond edge detection leads to failure.	→ Add no-road detection mode and exploratory steering sweep under uncertainty.	→ new best
	Claude Code s007 120 ep	Performance improves briefly then plateaus and degrades around mid-return range.	→ Simple offset-based policy is more stable than more complex variants.	→ Revert to uniform offset policy with light braking and minimal recovery logic.	→ new best
DeepSeek-V4-Pro	s007 32 ep	Small improvement followed by consistent regression to negative returns.	→ Local tuning is insufficient; optimization path has stagnated.	→ Replace controller with structural redesign instead of parameter tweaks.	→ No improvement
	Claude Code s017 84 ep	Final checkpoint unchanged due to lack of better candidates.	→ No new improved policy emerges during search.	→ Re-evaluate current policy under higher evaluation budget.	→ retest
